

SALES PERFORMANCE DASHBOARD

PROJECT REPORT

Submitted by,

CHINMAYA A S

INTRODUCTION

This project focuses on creating an interactive Sales Performance Dashboard using Power BI Desktop. The objective of the dashboard is to analyze sales data and present meaningful business insights related to sales, profit, regions, categories, and salesperson performance. The dashboard is designed to be clean, professional, and easy to understand for business users.

OBJECTIVES

The main objectives of this project are:

- To visualize overall sales performance using KPIs.
- To analyze sales across different product categories and regions.
- To identify top-performing salespersons.
- To calculate order processing duration using DAX.
- To apply conditional logic for business-specific analysis.
- To enable hierarchical drill-down analysis for better decision-making.

TOOLS AND TECHNOLOGIES USED

- **Tool:** Power BI Desktop
- **Language:** DAX (Data Analysis Expressions)
- **Data Source:** Sales dataset (CSV/Excel)

TASKS

Sales Dashboard Creation

A dashboard page was created with:

- Heading: Sales Analysis Dashboard
- Company logo
- Proper alignment of visuals
- Professional background and formatting

Category-wise Sales Analysis

Display Category-wise Total Sales using an appropriate visual.

```
Total_sales_sum = SUM(Retail_Sales_Data[Total_Sales])
```

Calculated Column – Order Duration

Create a calculated column to find the duration (number of days) between Order Date and Ship Date.

```
Order_Duration = DATEDIFF(Retail_Sales_Data[Order_Date],Retail_Sales_Data[Ship_Date],DAY)
```

Top Salesperson Identification

Identify the Top 2 Salespersons based on Total Sales and visualize the result.

Y-axis

Sum of Total_Sales ▾ ×

Region-wise Profit Analysis

Create a visual to show Region-wise Total Profit.

`Total_Profit = SUM(Retail_Sales_Data[Profit])`

KPI Cards

Create KPI cards to display Total Orders, Total Sales, and Total Profit.

Three KPI cards were created:

1. Total Orders

2. Total Sales

3. Total Profit

```
Total_Orders = DISTINCTCOUNT(Retail_Sales_Data[Order_ID])
```

Total_Profit = SUM(Retail_Sales_Data[Profit])

Hierarchical Sales Analysis

Using hierarchy, display Total Sales in the order: Region → Country → State → City. Enable drill-down and drill-up functionality.

Conditional Logic & Visualization

Using DAX IF condition: If Category = Clothing and Sub-Category = Shirt, label it as 'Shirt Sale'; otherwise label it as 'Other Sale'.
Create a visual to show Total Sales based on this condition.

```
Sales Type = IF(Retail_Sales_Data[Category]="Clothing" && Retail_Sales_Data[Sub_Category]="Shirts","Shirt Sale","Other Sale")
```

SALES PERFORMANCE DASHBOARD

Key Insights

- Certain categories contribute significantly more to total sales.
- A small number of salespersons generate the highest revenue.
- Some regions are more profitable than others.
- Shirt sales form a distinct portion of total clothing sales.
- Order processing time varies across orders.

Conclusion

The Sales Performance Dashboard successfully transforms raw sales data into meaningful insights using Power BI. By applying DAX calculations, interactive visuals, and hierarchical analysis, the dashboard supports effective business decision-making. This project demonstrates practical skills in data visualization, data modeling, and analytical thinking using Power BI.
